Adobe software and Mac OS X

Adobe supports the direction Apple is taking with Mac OS X. Apple's new operating system promises to ultimately deliver a powerful desktop platform with enhanced stability and reliability for the Macintosh customer.

Currently, most of Adobe's software products do not offer native Mac OS X support. Adobe plans to support Mac OS X native mode in future releases of our flagship products, beginning with Adobe Acrobat Reader® 5.0.

We will continue to update our customers, partners, and the press on the status of our products running on Mac OS X, both in Classic and native modes. For specific information on a particular Adobe application, including performance levels, click the appropriate link at left.
